

MULTI-FACTOR AUTHENTICATION

01

Increased Security

MFA adds a layer of security beyond just a password. This makes it more difficult for a hacker to gain access to sensitive data.

02

Compliance

Many industries require MFA to be in place in or to protect both data and systems. Does your organization need it?

03

Protection

Data breaches are costly and damage your business. MFA reduces the risk of data breaches by adding an extra layer of security.

04

Ease of Use

MFA is easy to use and can be implemented without disrupting your business. You simply add it to your mobile phone and away you go!

05

Cost-Effective

The cost of implementing MFA is significantly lower than any data breach. Make this investment now to protect yourself into the future.
